

News release no. 5/2022

2022.05.17

Iceland Leading Indicator – Highest reading in an upswing since 2007

The Iceland Composite Leading Indicator (CLI) rose in April. Despite various uncertainties there is still outlook for continued recovery at least into the latter half of year 2022. Tourism seems to be on a strong recovery path. However, the deviation of the CLI above the base value of 100 is already large in historical perspective. Hence, the CLI seems to be entering a zone where a turning point might occur.

Four out of six CLI components rise on the previous month. The largest contributions are due to an increase in tourist arrivals, an increase in fish catches and in merchandise imports. Despite the strong outlook there remains uncertainty regarding developments in the tourism industry, the war in Ukraine and in the evolution of the pandemic. The developments in financial markets are also a risk factor in view of rising inflation as various central banks are in the process of reducing the monetary slack.

Turning points of the CLI tend to precede turning points in economic activity relative to trend by approximately six months. Economic activity in terms of GDP is measured by Statistics Iceland. The calculation of Analytica's CLI is based on methodology adopted by the OECD.

Chart 1. GDP and Analytica's CLI – Trend Adjusted

Long term trend = 100

Chart 1 depicts Analytica's CLI together with trend adjusted GDP. The chart shows that the CLI leads GDP on average by around six months.

Chart 2 depicts the development of debit card turnover at domestic retailers for the period 2007-2022. The figures are at fixed prices and seasonally adjusted and smoothed. Debit card turnover is one of the CLI components and empirically it provides an early indication of the business cycle. This means that turning points in debit card turnover tend to appear earlier than the CLI turning points but with less reliability.

The dark blue curve in chart 2 shows the deviation of debit card turnover from the long-term trend whereas the brown curve depicts the debit card turnover year on year change. The curves indicate that debit card turnover has slowed down but seems to be on the rise again. This indicates the continuation of a robust recovery.

Chart 2. Debit card turnover – Deviation from long term trend and YoY %-change
Seasonally adjusted and smoothed at fixed prices

The same curves as shown in chart 2 are depicted in the Appendix charts A1 and A2. The purpose of chart 2 is to highlight developments of the index.

There are six components of Analytica’s CLI. These are: Fish catches, inflation adjusted debit card turnover, number of tourists visiting Iceland, the MSCI World equities index, inflation adjusted imports and the Gallup Index of Consumer Confidence. For the month of April, four out of six underlying components rise year on year. Also, four out of six components rise on the previous month. See Appendix, Charts A1 and A2.

Some revisions to the CLI values have taken place. This is a result of component revisions and in part a result of the methodology employed, including the long-term trend estimate.

Table 1 shows the development of the CLI during the past twelve months. The index for April rose on the month to a value of 105.4. This serves as an indicator to economic activity six months into the future, i.e. October 2022. A value of 100 indicates GDP in line with its long-term trend.

Table 1. Analytica's CLI 2021-2022

	Index	Change in %		Indication for month
		on month	YOY	
2021				
April	97.0	0.5%	2.1%	Oct.
May	97.6	0.6%	3.3%	Nov.
June	98.3	0.7%	4.4%	Dec.
July	99.0	0.7%	5.5%	Jan. 2022
August	99.7	0.7%	6.5%	Feb.
September	100.5	0.7%	7.4%	March
October	101.2	0.7%	8.0%	April
November	101.8	0.6%	8.2%	May
December	102.4	0.6%	8.2%	June
2022				
January	103.0	0.5%	8.0%	July
February	103.5	0.5%	7.9%	August
March	104.3	0.7%	8.1%	Sept.
April	105.4	1.0%	8.7%	Oct.

The May Composite Leading Indicator is scheduled for release on June 16, 2022.
